**Report of Results: MVA12910**

**Investigation of Chanel/Brenntag Specialties  
Supra H USP (Chinese) Talc Samples for Asbestos**

**Introduction**

This report presents the results of an investigation for asbestos in 18 mineral samples identified as Chanel/Brenntag Specialties Inc. Supra H USP talc ore sample retains dated between January 2010 and September 2013. During this time period, Chanel obtained the mineral powders from Imerys Talc America, Inc. who sourced the ore from Guangxi, China and milled the ore in Houston, TX [1]. The 18 samples were initially sent to Maxxam Analytics/Bureau Veritas North America in Kennesaw, GA from the MG&M Law Firm in Boston, MA at the request of Chanel, Inc. Dr. Steven Compton of MVA Scientific Consultants witnessed the splitting of each sample by Bureau Veritas at their facility on 5 November 2018 and took custody of one split from each sample (see attached chain of custody). Upon receipt at MVA, each sample was assigned a unique MVA sample ID number as listed in Table 1.

It was requested that we investigate the mineral samples for the presence of asbestos fibers. The analyses of the 18 mineral samples were performed during the period 5 November 2018 to 21 September 2020.

**Methods**

During the splitting process at Bureau Veritas, photographs were taken of each original sample container using a Nikon D60 DSLR camera (Figures 1 through 18). Each sample was analyzed according to the transmission electron microscopy (TEM) procedure outlined in Dr. Millette's 2015 paper "Procedure for the Analysis of Talc for Asbestos" [2]. Mineral particulate was extracted from the 18 powdered samples directly via a disposable plastic laboratory spatula. A representative portion of each sample was weighed, suspended in filtered deionized water, and a known aliquot was extracted and filtered through a 0.4 micrometer pore size membrane filter. Each filter was dried and grids prepared following standard direct preparation procedures [2, 3, 4] for analysis by transmission electron microscopy (TEM). The grids were examined using a Philips EM 420 TEM equipped with a Thermo Scientific Noran System 7 energy dispersive spectroscopy (EDS) x-ray analysis system capable of selected area electron diffraction (SAED).

Talc fibers were not counted, but were discounted after confirming their identity by elemental composition and observation of a pseudo-hexagonal diffraction pattern, consistent with the reported literature [2]. Asbestos fibers were designated as such based on their elemental composition and random-oriented diffraction patterns. When possible, a zone axis pattern was indexed to confirm the mineral identity for anthophyllite. A standard TEM asbestos fiber counting criteria of fibers greater than 0.5 micrometer in length with at least a 5:1 aspect ratio (length:width) as described in ISO 10312 [3] was used. For each prepared sample, a laboratory blank sample was

prepared following all of the same procedures except for the addition of test material. The TEM results for asbestos are given in terms of percent by weight and fibers (including bundles and classifications of structures) per gram.

## Results and Discussion

A summary of the TEM results is provided in Table 2. Lengths and widths of the asbestos structures (fibers and bundles) observed by TEM in the Chanel/Brenntag Supra H samples are provided in Table 3. During the TEM examination, numerous platy and fibrous talc particles were observed. In addition to talc, four samples contained one to two fibers of anthophyllite ranging in concentrations from 11.0 to 26.9 million fibers per gram. Analytical sensitivities for the remaining samples (in which no asbestos structures were detected) are approximately 15 million fibers per gram or lower. TEM images and spectra of fibers observed in the sample set are provided in Figures 19 through 30. No amphibole, chrysotile, or talc fibers were detected in the analyzed blank samples. TEM count sheets are included in the Appendix.

## Conclusions

Asbestos fibers were detected by TEM in 4 of the 18 Chanel/Brenntag Supra H samples sourced from China dated between January 2010 and September 2013. Aside from the talc itself, fibrous particles detected in the sample set include anthophyllite. For samples in which asbestos was detected, the asbestos content ranged from approximately 11.0 to 26.9 million fibers per gram.

Fiber release simulations of consumer talcum powder products containing between 3 million and 70 million asbestos fibers per gram resulted in elevated concentrations of airborne asbestos fibers during application of those products [4]. It is expected that aerosolization of these samples or any powder consumer product containing these samples as a constituent ingredient would likewise result in elevated concentrations of airborne asbestos fibers.

October 29, 2018

To Whom It May Concern:

This parcel is being sent through Federal Express and contains raw material for laboratory use – 18 pieces of white talc in 4oz glass jars. Through the appropriate chain of custody channel (please see included forms) is making its way to the laboratory located at:

Alan M. Segrave  
Maxxam Analytics  
3380 Chastain Meadows Parkway  
Suite 300  
Kennesaw, GA 30144

We certify the above goods are not for sale, not for resale, and have no commercial value. Please reach out with any issues.

Sincerely,

A handwritten signature in black ink, appearing to read 'Megan K. Sullivan', written in a cursive style.

Megan K. Sullivan  
Paralegal
